

The PANTHER

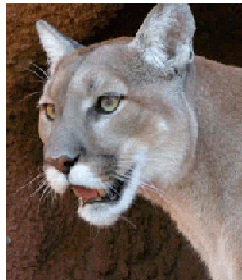

Our upright band prototype, shown here sitting against an old Farquiere hand carriage. This picture shows a gas engine mounted, but we have since switched to 25 hp. Electric 3-phase

This machine will make the lumber fly. Minimum 2 man operation, large logs will require 3 men.

Looking for a safer way to saw? More production? Safer operating environment? The PANTHER gives customers a number of possible setups because it is a component. Replace your old husk and circle saw, but use the same carriage; start from scratch with a new, affordable setup. We offer a power table to move lumber away from the blade. Can be constructed with a jack-shaft that allows other items to be powered, such as an air compressor or generator.

We know that situations will vary, so call today and discuss your operation with Ken at 814-571-1025 and determine if the PANTHER is right for you.

Hydraulic levers are mounted on a stand that is positioned on the deck with the sawyer (not shown here).

We use a sawdust blower to remove sawdust, but an auger is also an option for removing sawdust, under your carriage track and out that side. It won't plug with bark and wood slivers like the suction pipe does on occasion.

The upright head rocks outward on a cam to allow cant to return without touching the blade. Get sawing right away, add log turner and power carriage later. It is all up to you.
